Unified Cloud Archive Service

As messaging systems have become one of the most critical application services within an organisation the need to archive, search and report on this data has become essential.

Secure

Archived messages are encrypted through Linux or Windows encrypted partitions, and encrypted iOS, Android, Blackberry, SMS and text messages are also archived.

Unified

Simultaneous support of a mixed messaging platform environment. Archive your Exchange, Office 365, Gmail, GroupWise, Social Media, and Mobile data into one repository.

Optimised

Supports single instance storage so email and attachments are only stored once, particularly useful for Exchange 2010, 2013, and Office 365 environments

Proven

Based on the proven GWAVA Retain application, a solution acknowledged by analysts, that has been available since 2008 and is in use in over 10,000 sites globally.

Flexible

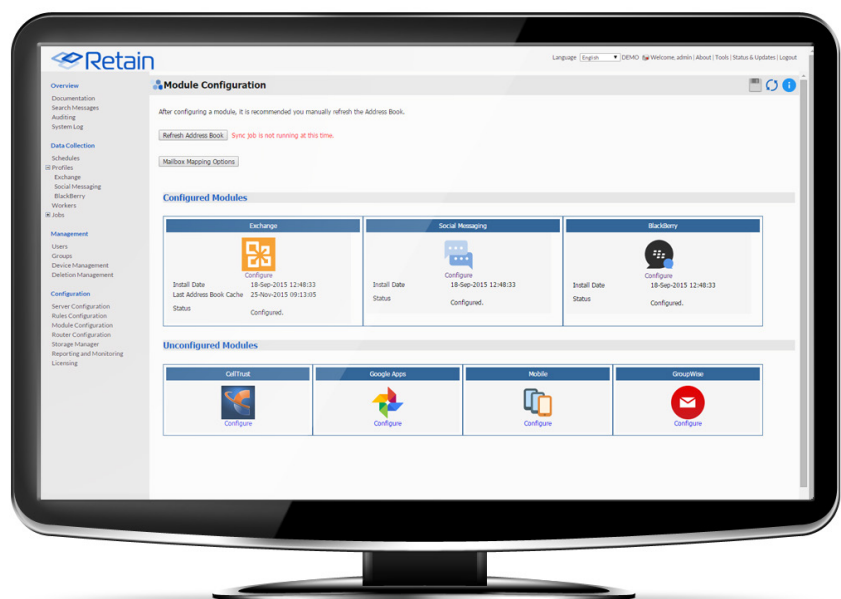

Consumption models to fit any design and budget, from pay as you grow to private cloud, your choice.

Unified Cloud Archive

The Unified Cloud Archive Service from Data2Vault supports the widest range of simultaneous data collectors for live users and leaver mailboxes with one integrated service, protecting the investment you make. As a policy driven system the administrator can determine what is archived, how long it is retained for, by mailbox, by source, by type, by age and by attachment.

The service also provides the necessary tools for eDiscovery, offering litigation hold, print, forward, save, redact, and export of your message data. Reducing cost, mitigating risk, and helping to manage complexity.

We can capture, index and protect it within one service, for one fee.

Unified Cloud Archive

A secure, unified and proven service that supports the widest range of data collectors, to protect your investment.

Delivered as you want:

Private Cloud

Your secure data centre

Public Cloud

Our secure data centre
